# What is Docker?

- Abstraction of physical hardware
- Multiple VMs on a single physical machine
- Each VM includes a full copy of the OS, the application and dependencies
- Can be 10s to 100s of GB
- Slow start-up

- Abstraction at the app layer
- Share the OS kernel with other containers
- Isolated processes in user space
- Fast start
- Portable
- Immutable

## Monolithic Applications

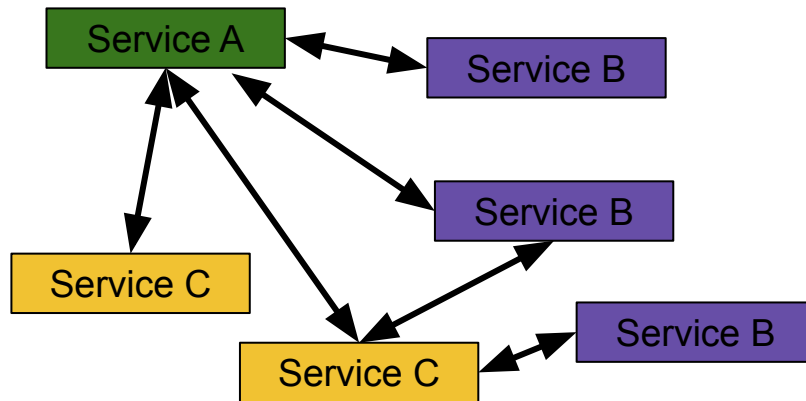

## Scaled Monolith

## Microservices

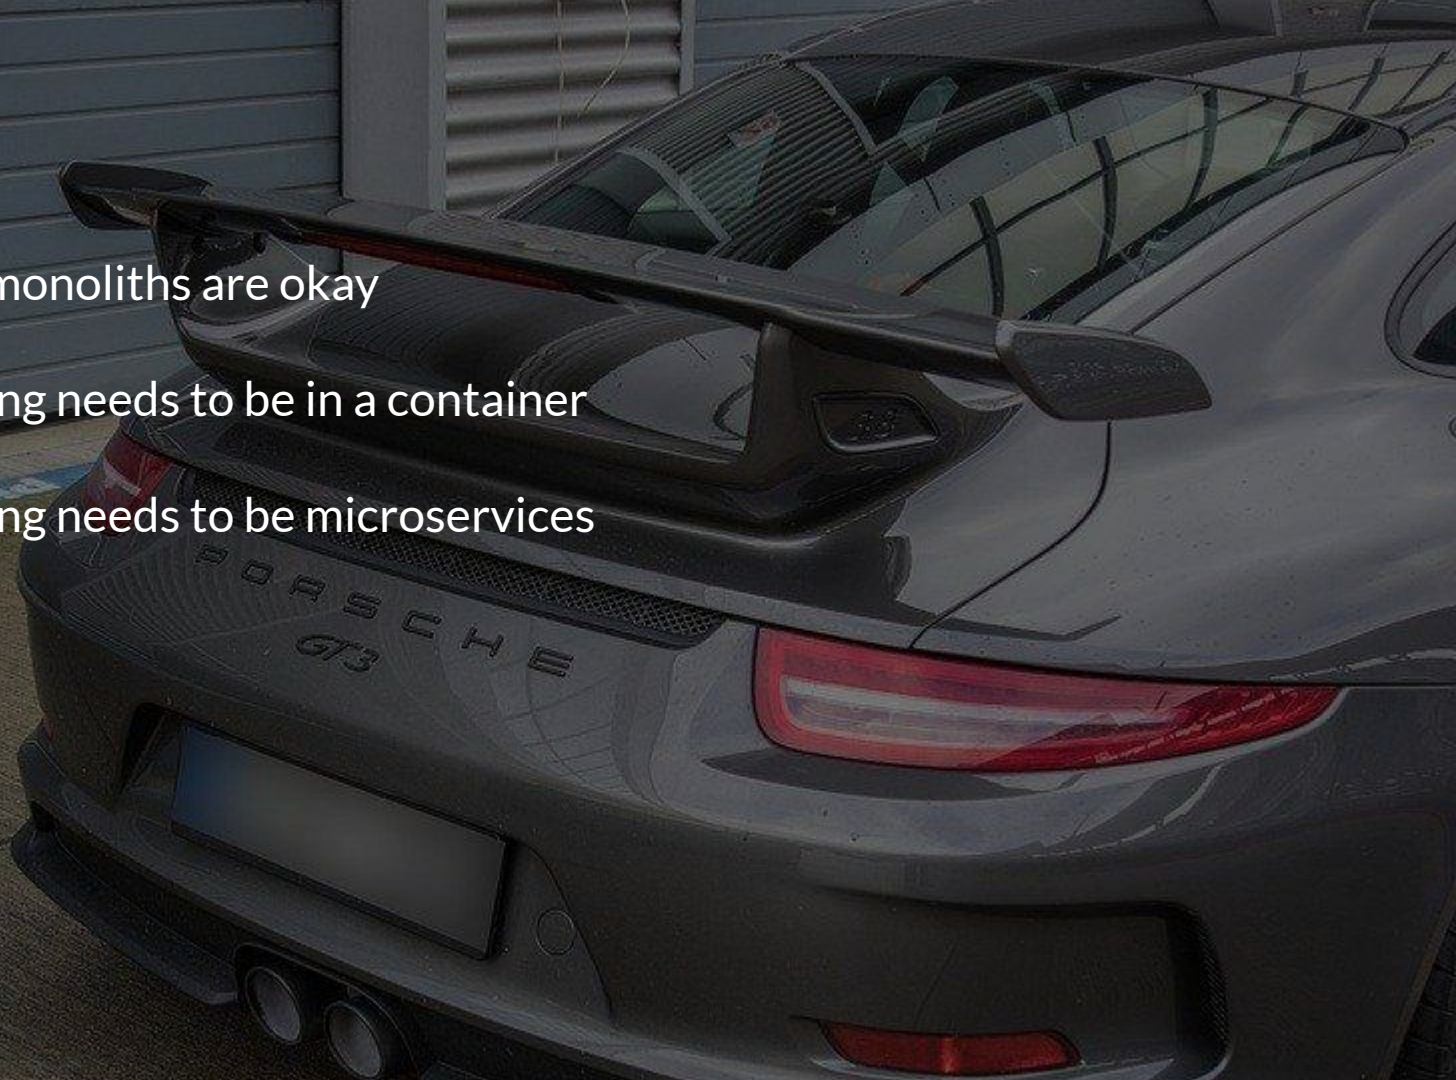

## Scaled Microservices

# Spoilers!

- Sometimes, monoliths are okay
- Not everything needs to be in a container
- Not everything needs to be microservices

# What is Azure DevOps?

Azure DevOps

- Application Lifecycle Management tool
- Integrates with *everything*
- Source Control
- Build
- Testing
- Release
- Package feeds
- Open Source and Private

# Demo

---

Commit  
to  
Github

Build in  
Azure  
DevOps

Push to  
Docker  
Hub

Run the  
built  
image

@lrgulliver

```
FROM httpd:latest
```

Base image

```
COPY ./public-html/ /usr/local/apache2/htdocs/
```

Website contents

```
EXPOSE 80
```

Port we're exposing

# Round up

- What is Docker?
- What is Azure DevOps?
- Creating a docker image
- Running a docker image
- Building it in Azure DevOps with a YAML build and publishing to a container registry
- Deploying it to Azure

---

# Thank you

@lrgulliver
